***What the Nose Knows ...***

People have about 5 million smell receptors that cover an area the size of a small Post-It note. Dogs have almost 220 million receptors packed closer together and covering an area 17 times larger! With all that smelling power it isn't surprising that the part of the brain that interprets smell is 15 times larger in dogs than humans. Your average dog's nose is at least a hundred thousand times more sensitive than a human's. The Bloodhound has the sharpest nose, perhaps as much as hundred million times better than man's.
